I have been preparing for this model since long, but only in the form of 3d models. Because of the limitations and the lack of reference blueprint images then makes this model less accurate. I only use a few photos to make this model. Based on the vehicle length obtained from the specification data, I made this model in 1 / 35 scale. The Zobel is produced by German military vehicle manufacturer GST (Gesellschaft fur Systemtechnik mbH) for light reconnaissance vehicles. Four-wheel suspension can be raised so that the vehicle body can be lifted upward to drive in off road terrain. The Zobel has not been actively used, it is still a prototype.
